## Related Rates (Related Derivatives) <br> Equations relating derivatives

Example: A cylindrical tank leaks water at 1 cubic meter/hour. What is the rate at which the height of the water is decreasing?

Example: A hot air balloon is rising and being pushed away by the wind. At what rate is the distance changing?

## Related Rate Problem Strategy:

1. Draw a picture and name the variables and constants. Use tfor time. Assume all variables are differentiable functions of $t$.
2. Write down the numerical information (in terms of the symbols you have chosen).
3. Write down what we are asked to find (usually a rate, expressed as a derivative).
4. Write an equation that relates the variables. You may have to combine two or more equations to get a single equation that relates the variable whose rate you want to the variables whose rates you know.
5. Differentiate both sides of the equation implicitly with respect to $\boldsymbol{t}$. Then express the rate you want in terms of the rate and variables whose values you know.
6. Evaluate and interpret. Use known values to find the unknown rate.

## Example 2 "A Rising Balloon"

Example: The base of a rectangular tub has length equal to one meter and width equal to four meters. The height of the tub is two meters. Water is flowing through a leak in the bottom of the tub at a rate of one cubic meter per hour. What is the rate at which the water level is decreasing?

## Example 3: "A Highway Chase"

## Example 4: Filling a conical tank
