the **difference quotient**,  $\frac{f(a+h)-f(a)}{h}$  but a better

approximation of the derivative, slope at a point is the f(a+b) = f(a-b)

symmetric difference quotient  $\frac{f(a+h)-f(a-h)}{2h}$ 

Your calculator uses numerical derivative of f at a point a. NDER or nDeriv (f(x), x, a) Ti-84 math #8 nDeriv (

OR d/x(f(x))

# $f(x) = x^{3} \text{ at } x = 2$ f'(2) = 12 $f(x) = x^{2} + 4x \text{ at } x = 1$ f'(1) = 6 f(x) = |x| at x = 0 $f(x) = x^{\frac{2}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$ $f(x) = x^{\frac{1}{3}} \text{ at } x = 0$

The calculator uses the symmetric difference quotient to find derivatives and uses .001 for the "h" If you have a ti-inspire the calculator gives a correct answer of dne.

Theorem 2 Intermediate Value Theorem for Derivatives: If a and b are any two points in an interval on which f is differentiable, then f' takes on every value between f'(a) and f'(b). Does any function have the unit step function as its derivative? "No" Let a<0 and b>0. U(a) =-1 and U(b) =1, but U does not take on any value between -1 and 1.
